

# Lab 9 Agent Build and Prompt Card

Build, ground and test the Requirements Discovery agent in Microsoft 365 Copilot.

**NO MANUAL TRANSFER**

The agent analyses and proposes. After human approval, Copilot in Excel updates the controlled register directly. Verify the visible result.

**1. Source inventory**

Inventory every configured Project Nova source. For each, show title, date/version, owner, authority, currentness, accessible evidence and any conflict. Treat Copilot recaps as navigation aids only.

**2. Gap analysis**

Before drafting requirements, identify missing actors, triggers, rules, exceptions, measures, owners, deadlines, permissions and integration evidence. Rank the questions by decision risk.

**3. Discovery interview**

Conduct a requirements discovery interview about [PROCESS]. Ask one focused question at a time. Explain why the answer matters. Explore actor, trigger, data, rule, exception, outcome and measure before suggesting a solution.

**4. TRUST extraction**

Apply TRUST to the workshop transcript, meeting chat and post-meeting discussion. Create candidate requirements with citations. Preserve conflicts and label every item Confirmed, Proposed, Assumption, Conflict, Not confirmed, Superseded or Out of scope.

**5. Recap challenge**

Compare the Copilot meeting recap with the original transcript, meeting chat, post-meeting discussion, policy and decision log. List every accurate, unsupported, contradicted or incomplete statement. Do not use the recap as evidence.

**6. Quality review**

Review every candidate for ambiguity, testability, duplication, conflict, hidden solution assumptions, scope, source quality and measurable acceptance criteria. Return blockers before recommendations.

**7. Field-level change**

Compare approved evidence with the existing Requirements Register. Return only the smallest approved field-level delta. Show current value, approved value, evidence, authority and all fields that must remain unchanged.

**8. Direct Excel update**

In the open Requirements Register workbook, apply only the approved changes listed below directly to the RequirementsTable. Add approved new candidates as Proposed rows. Preserve existing IDs, formulas, formatting and every unrelated field. Before applying, preview the exact rows and cells. After applying, report changed cells and confirm unchanged controls.

# Agent Builder path

- 1 Open Microsoft 365 Copilot.
- 2 Select Agents > New agent.
- 3 Select Skip to configure for the controlled route.
- 4 Enter Requirements Discovery as the name.
- 5 Paste the supplied description and instructions.
- 6 Add the Project Nova SharePoint folder.
- 7 When supported, add the specific workshop meeting and specific meeting chat.
- 8 Turn on Only use specified sources and turn off web search for the case.
- 9 Use Try it to run the supplied test set before sharing.

**KNOWN LIMITATION**  
Only use specified sources prioritises the selected knowledge but does not completely block general model knowledge in Agent Builder. Require citations and reject unsupported answers.

# Two knowledge paths

| Path                   | Knowledge                                                | Configuration                                                |
|------------------------|----------------------------------------------------------|--------------------------------------------------------------|
| A - Connected Teams    | Licence and tenant allow specific meeting/chat knowledge | Specific meeting, specific chat and SharePoint folder        |
| B - Synthetic fallback | Connected Teams knowledge is unavailable                 | Supplied transcript, chat and source documents in SharePoint |
