

Lab 11 - From Scanned Evidence to a Verified Business Record

Participant workbook | Level 300 | 60-75 minutes

Purpose

Test how reliably Copilot extracts business fields from clean, degraded and visually complex evidence. The objective is not to make Copilot fail. It is to identify the boundary between readable, uncertain and unsafe information before any value reaches a controlled record.

Expected result

- A completed Image Extraction Validation Register with source, location, extracted value, confidence and verification status.
- Ambiguous values marked **Not confirmed** rather than guessed.
- Only human-approved fields released to the Verified Business Record sheet.
- A controlled one-input-change test showing that only the intended extraction changes.

Capability check

Check	Record
Can you attach PNG/JPG/PDF files?	Yes / No
Can the selected Copilot experience create or edit a file?	Yes / No
Can you download a structured CSV/XLSX result?	Yes / No
Is SharePoint OCR enabled in the workshop tenant?	Yes / No / Unknown

The IMAGE framework

Gate	Question	Required action
I - Image quality	Is the page clear, complete, correctly rotated and readable?	Check resolution, rotation, contrast, crop and page completeness.
M - Missing content	Is anything cropped, obscured, blurred or absent?	Mark the affected field Not confirmed.
A - Accuracy	Does the extracted value exactly match the visible content?	Compare character by character, including decimal points and checkbox state.
G - Ground truth	Can the value be verified against an authoritative source?	State the control source and location.
E - Escalation	Can the field safely enter the business record?	Obtain human approval or stop the transfer.

Exercise 1 - Establish the control

- 1 Download **01_Project_Nova_Control_Text.pdf** and the two Excel workbooks.
- 2 Open the control PDF yourself before testing Copilot. Record its version and status as the authoritative comparison source.
- 3 In the Validation Register, keep the Ground Truth column hidden or unopened for the first extraction pass if you want a blind test.
- 4 Do not upload the trainer answer key.

Exercise 2 - Test the clean image

- 1 Attach **02_Project_Nova_Clear_Scan.png** to Microsoft 365 Copilot Chat.
- 2 Use the supplied extraction prompt. Require a separate row for every requested field.
- 3 Ask Copilot to update the Validation Register directly when file editing is available.
- 4 Verify the Request ID, dates, cost centre, amount and checkbox values character by character.

Exercise 3 - Stress-test image quality

- 1 Repeat the extraction with the low-resolution scan, rotated phone photo and cropped page.
- 2 Do not help Copilot by correcting the orientation or telling it which value is missing during the first pass.
- 3 Record every omission, substitution, row shift and unsupported inference.
- 4 If Copilot returns a plausible value that is not visible, classify it as Unsupported - not Correct.

Exercise 4 - Test visual semantics

- 1 Test the checkbox form. Require Copilot to state how each selection was visually indicated.
- 2 Test the handwritten correction. Require Copilot to distinguish printed facts from handwritten proposals.
- 3 Test the photographed table. Require Request ID AR-2048 to remain associated with the correct row.
- 4 Test the hybrid PDF. Treat the stamp and signature as visual evidence that requires human interpretation.

Exercise 5 - Update without manual copying

Available capability	Required method
Copilot can edit the workbook	Attach the source image and Validation Register; instruct Copilot to write directly into AI Extraction columns only.
Copilot can create a file but not edit the workbook	Ask Copilot to create a downloadable CSV/XLSX using the exact register headers, then import it through Excel Data
Copilot returns chat text only	Do not manually transfer rows. Complete the comparison on screen or move to an approved file-creation experience

Exercise 6 - Release verified fields

- 1 Filter the register to IMAGE Decision = Human approved.
- 2 Ask Copilot in Excel to update only the matching fields in Verified Business Record.
- 3 Do not release the proposed handwritten end date. It remains Not confirmed until Priya Nair approves it.
- 4 Compare the before and after values. All unrelated fields must remain unchanged.

Exercise 7 - One-input-change test

- 1 Replace only the low-resolution scan with **10_Project_Nova_Improved_Replacement.png**.
- 2 Predict which extraction errors should improve.
- 3 Rerun the same prompt without changing any other parameter.
- 4 Confirm that only results associated with that source change. Preserve the audit history.

Optional enterprise path - SharePoint OCR

If an administrator has enabled SharePoint OCR, upload a copy of the image to the approved SharePoint test site. Record whether extracted text is available as metadata or search indexing and compare it with the one-off Copilot result. OCR enablement, supported format and indexing behavior vary by file type. Only files uploaded after enablement are processed.

Debrief

- Which formats were supported?
- Which values were actually accurate?
- Which confident answers were unsupported?
- What evidence required human visual interpretation?
- What must happen before extracted data can update a controlled system?
