

# Lab 11 - Trainer Demo and Answer Key

Expected findings, control values and facilitation guidance. Do not distribute before the participant test.

## Trainer demonstration sequence

- 1    Begin with the clear scan and allow participants to see that image support can work well.
- 2    Move to the low-resolution and cropped examples. Ask which answers are accurate versus merely plausible.
- 3    Use the checkbox and handwriting examples to distinguish text recognition from visual interpretation and authority.
- 4    Show the direct workbook update or structured file-import path. Do not model row-by-row copying.
- 5    Release verified fields, then rerun the one-input-change test.

## Expected findings

| Source                  | Expected challenge                                  | Correct treatment                                                                      |
|-------------------------|-----------------------------------------------------|----------------------------------------------------------------------------------------|
| 01 Control PDF          | None; authoritative text control                    | Use as ground truth.                                                                   |
| 02 Clear scan           | Image extraction despite clean visual               | All printed fields should be readable; still verify.                                   |
| 03 Low-resolution       | AR-2048, CC-4710, 1,250.00 and dates may be blurred | Mark as matches or uncertainty; never repair from memory.                              |
| 04 Rotated photo        | Orientation, background and reduced contrast        | Record quality issue; rotate only in the second pass.                                  |
| 05 Cropped page         | Approver, status and controls are absent            | Return Not confirmed; do not borrow them from another file silently.                   |
| 06 Checkbox form        | Different marks indicate selections                 | Explain visual mark for each result; Emergency access = No.                            |
| 07 Handwriting          | Proposed end date 2027-01-15                        | Keep printed end date 2026-12-31 as approved. Handwriting is Proposed / Not confirmed. |
| 08 Hybrid PDF           | Searchable text plus visual stamp and signature     | Do not identify signer or approval scope from appearance alone.                        |
| 09 Table photo          | Row association and similar cost-centre digits      | Keep every AR-2048 field on the same row.                                              |
| 10 Improved replacement | One source improves                                 | Only extraction results linked to the replaced source may change.                      |

## Authoritative values

| Field          | Expected value      |
|----------------|---------------------|
| Request ID     | AR-2048             |
| Requester      | Mika Olsen          |
| Business unit  | Finance Operations  |
| Access type    | FinanceHub Approver |
| Environment    | Production          |
| Effective date | 2026-09-15          |

| Field        | Expected value           |
|--------------|--------------------------|
| End date     | 2026-12-31               |
| Cost centre  | CC-4710                  |
| Licence cost | EUR 1,250.00             |
| Approver     | Priya Nair               |
| Status       | Approved with conditions |

## Control decisions

| Item                 | Expected decision                                                            |
|----------------------|------------------------------------------------------------------------------|
| Printed end date     | 2026-12-31 remains the approved business-record value.                       |
| Handwritten end date | 2027-01-15 remains Proposed / Not confirmed.                                 |
| Stamp and signature  | Visual marks requiring human confirmation; no automatic identity conclusion. |
| Cropped fields       | Not confirmed, even if another file contains the value.                      |
| Final transfer       | Only human-approved rows update the business record.                         |

## Discussion questions

- Did Copilot communicate uncertainty, or did it simply omit fields?
- Which error would create the highest business risk?
- Did participants confuse a supported format with an accurate result?
- What evidence was suitable for automation, and what required human visual judgement?
- Which SharePoint OCR controls would the organisation need before scaling this workflow?
