

Lab 7 Copilot Dashboard Prompt Card

Reusable prompts for source inspection, dashboard creation, refinement, testing and management interpretation.

WORKING RULE

Copilot may create and refine the report. It must not silently correct source data, infer missing values or make the management decision.

1. Inspect the SharePoint list

Review the SharePoint list IT Project Delivery Register.

Before creating anything, report:

1. fields and likely data types;
2. blank values;
3. logically conflicting records;
4. values that may create misleading dashboard results;
5. fields that should be treated as categories, dates, currency or numbers.

Do not modify the list. Do not correct or infer missing information. Reference the Project ID for every issue.

2. Propose the dashboard before creation

Using only the SharePoint list IT Project Delivery Register, propose an interactive project portfolio dashboard.

Include KPI cards for total active projects, Red projects, projects over budget, projects forecast late, stale updates and decisions required.

Include filters for Department, Project Manager, Stage, RAG Status and Decision Required.

Include charts for RAG distribution, projects by stage, approved budget versus forecast cost and schedule variance.

Include a searchable exception table and links to the related SharePoint list items.

Rules:

- do not invent or correct missing values;
- display missing values as Not confirmed;
- do not infer RAG from dates or budget;
- keep conflicts visible;
- show the source-list name and data date;
- show the proposed structure and wait for confirmation.

3. Create the connected report

Create the approved interactive HTML dashboard from IT Project Delivery Register.

Keep the report connected to the underlying SharePoint list.

Do not modify list items.

Include the approved KPIs, filters, charts, searchable exception table, source links and visible data-quality warning.

Use Not confirmed for missing values. Do not resolve source conflicts.

4. Refine only the presentation

Update only the dashboard presentation.

Add:

- a combined Red and Amber exception filter;
- a warning for records not updated within 14 days;
- sorting by Open Critical Issues, then Schedule Variance Days;
- a Decision Required section;
- a data-quality count for records with missing or conflicting information.

Keep the SharePoint list and all source field values unchanged.

Show the proposed dashboard changes and wait for confirmation.

5. Audit dashboard totals

Compare the dashboard with the connected SharePoint list.

Return the source definition and current value for every KPI. Identify records excluded because of blank, invalid or conflicting data. Do not correct the list.

Flag any KPI or chart that could lead to a misleading management conclusion.

6. Predict the one-field impact

Controlled test: change only IT-017 RAG Status from Amber to Red.

Before any change, identify exactly which dashboard KPI, chart and table row should change. Return before value, expected after value and expected delta.

List every KPI and source field that must remain unchanged. Do not modify anything yet.

7. Apply one source-field change

Update only the RAG Status field of SharePoint list item IT-017 from Amber to Red.

Do not edit another field, item, list setting or dashboard definition.
Show the exact target item and field, wait for confirmation, then apply.
Return the before-and-after value and confirm the item ID.

IF DIRECT LIST EDITING IS UNAVAILABLE

Open IT-017 in the SharePoint list and change only RAG Status. This is a single controlled source update, not a manual transfer of Copilot output.

8. Recheck after the change

Refresh or reopen the connected dashboard and verify the IT-017 controlled test.

Expected:

- Red projects: 3 -> 4;
- Amber projects: 13 -> 12;
- Green projects: unchanged at 13;
- total projects: unchanged at 30;
- over-budget projects: unchanged at 16;
- forecast-late projects: unchanged at 16;
- decisions required: unchanged at 15;
- approved budget: unchanged at EUR 6,925,000.

Report any unexpected change. Do not repair it automatically.

9. Produce management conclusions safely

Analyse the dashboard and provide three management conclusions.

For each conclusion:

- identify the supporting SharePoint records;
- separate a confirmed fact from an interpretation;
- identify missing or contradictory data;
- state whether management can safely act on it;
- name the human role that owns the final decision.

Do not treat a visually prominent chart as proof that the source data is correct.

Expected control totals before the test

Control	Expected value
Total projects	30
Active projects	27
Red / Amber / Green / blank	3 / 13 / 13 / 1
Over budget	16
Forecast late	16
Stale updates	2
Decision required	15
Records with quality flags	10
Approved budget	EUR 6,925,000

FINAL RESPONSIBILITY
A live report improves visibility. It does not replace source governance, financial validation, project ownership or the management decision.
