

From Copilot Chat to a SharePoint Knowledge Backlog

Extract reusable evidence, verify it, promote it into a controlled Word document and query the shared record by Backlog ID.

PROMOTION RULE

Do not archive complete chat transcripts. Promote only verified, reusable information after human approval.

1. Create a backlog candidate

Single-conversation extraction

Review only this Copilot conversation.

Prepare one candidate record for the Copilot Conversation Knowledge Backlog.

Return:

- Project
- Chat title
- Conversation date
- Purpose
- Information type: Assumption, Proposal, Decision, Action, Prompt or Insight
- Extracted outcome
- Owner
- Deadline
- Authority: Draft, Recommended or Confirmed
- Status
- Supersedes another record: Yes or No
- Keywords
- Exact evidence from this conversation
- Missing or conflicting information

Do not use information from another conversation. Write Not confirmed when a value is missing. Do not create a decision or action from a suggestion.

2. Verify before promotion

Backlog exception review

Compare the proposed backlog record with this original conversation.

Flag:

1. Any project-name mismatch
2. Any summary not supported by the conversation
3. Any proposal labelled as a confirmed decision
4. Any inferred owner or deadline
5. Any missing conflict
6. Any record that should be Rejected, Hold or Superseded

Do not rewrite the record. Return only exceptions and a clarification question for each.

Human approval gate

- Approve only when the project, date, type, authority, status and evidence are correct.
- Use Hold when required information is missing or conflicting.
- Use Rejected for the wrong project, unsupported content or information that is not reusable.
- Use Superseded when a later approved record explicitly replaces the earlier position.

3. Query the SharePoint backlog

In Copilot Chat, type / and select Copilot Conversation Knowledge Backlog.docx. Then use this prompt.

Current project position

Using only the referenced Copilot Conversation Knowledge Backlog document:

1. What is the current confirmed UAT start date?
2. Which previous dates were superseded?
3. Who owns migrated-user sample validation?
4. Which access restriction remains active?
5. Which Project Atlas questions remain unresolved?
6. Which records were rejected or excluded?

For every answer, cite the Backlog ID.

Treat only records with Status Current and Authority Confirmed as final.

Do not use Superseded, Rejected or unrelated records as the current position.

Open work

Using only the referenced backlog document, list open Project Atlas items.

Include Backlog ID, item, information type, owner, deadline, missing information and one clarification question.

Exclude Closed, Rejected and Superseded records. Do not invent an owner or deadline.

4. Produce an auditable timeline

Decision evolution

Using only the referenced backlog document, create a Project Atlas decision timeline.

For every record include:

- Backlog ID
- Conversation date
- Information type
- Authority
- Status
- Extracted outcome
- What it supersedes

Preserve assumptions and proposals as history. Clearly identify the one current confirmed position. Flag any sequence that cannot be proven from the document.

FALLBACK

If direct Word editing is unavailable, generate the candidate in Copilot Chat, verify it, and paste the approved record into Word manually. Referencing a file is not the same as editing it.

Optional Notebook comparison

Move selected chats into a Copilot Notebook and compare its synthesis with the controlled SharePoint backlog. The Notebook is a curated AI workspace; the SharePoint document is the agreed shared record for this lab.
