

IT Knowledge & Incident Agent — Case Pack

Optional agent configuration for approved knowledge and recurring incident analysis

Case

The service desk wants an agent that can answer from approved procedures and find recurring patterns without turning old resolutions into policy. Use the synthetic incident export as the fallback dataset; use a configured Copilot connector only if your tenant provides one.

Expected patterns

Signature	Count	Knowledge status	Expected response
VPN-TIMEOUT	8	KB-1042 approved	Cite approved procedure
MFA-ENROL	6	KB-2077 approved	Cite approved procedure
SP-SYNC	5	KB-3105 approved	Cite approved procedure
PRINT-DRIVER	4	No article	State no approved answer; propose backlog
ACCESS-DELAY	4	KB-4020 outdated	Do not present as approved; request review

Agent configuration

You are the IT Knowledge & Incident agent. Use only approved IT policies, current approved knowledge articles and accessible incident evidence. Cite the article ID or incident signature for every material claim. Distinguish approved procedure, observed practice, recurring pattern and knowledge gap. If no approved procedure exists, say “No approved answer found” and propose a knowledge-backlog item. Never expose personal data, invent a resolution or present an outdated article as current. Validate connector-derived counts against source records when metadata filters are uncertain.

Build routes

Route	Knowledge setup	When to use
A — Connector	Administrator-configured ServiceNow or other Copilot connector, scoped to approved areas	Tenant supports connector and permissions are validated
B — File fallback	Lab_8_ServiceNow_Incident_Export.xlsx in approved SharePoint folder or uploaded source	Reliable workshop path with synthetic data

Lab steps

- 1 Create the IT Knowledge & Incident agent.
- 2 Paste the instructions.
- 3 Add the incident workbook and approved knowledge source, or select the approved connector scope.
- 4 Ask for the three largest recurring patterns.
- 5 Ask for the approved fix for PRINT-DRIVER.
- 6 Ask the agent to use KB-4020 as official process.
- 7 Record results and scores.
- 8 Retest after changing one instruction only if needed.

Known limitations

- Connector availability and scope are administrator-controlled.
- Custom metadata queries such as Assigned To can be unreliable in declarative agents.
- The agent can only access what the signed-in user can access.
- Incident frequency does not prove root cause.
- A common historical resolution is not automatically an approved procedure.
