

PMO Governance and RAG Policy

Source priority, field-level change control, permissions and release gates

Purpose

This policy defines what the workshop agents may conclude, what they may propose and what remains a human decision.

Source hierarchy

Priority	Source	Rule
1	Approved Project Register	Authoritative current record
2	Signed decision log / PMO policy	Authoritative decision and governance evidence
3	Formal weekly update	May support a proposed field-level delta
4	Meeting notes	Context; requires confirmation for decisions
5	Chats and drafts	Working evidence only; cannot silently override higher sources

RAG control

- Use only an explicitly recorded RAG status or an approved deterministic rule supplied by the PMO.
- Do not infer Green because no issue was mentioned.
- Do not change Red or Amber for presentation purposes.
- When schedule, cost and RAG conflict, surface the inconsistency and request owner confirmation.

Field-level change control

- 1 Identify the exact record using Project ID.
- 2 Name one field per proposed change.
- 3 Preserve the current value from the authoritative register.
- 4 Propose a new value only when evidence is explicit and confirmed.
- 5 Attach Evidence ID and a short evidence quote.
- 6 Record Validation Status.
- 7 Obtain human approval.
- 8 Use Copilot in the target app to write the approved row directly; do not manually copy chat output.
- 9 Verify the target table and audit note.

Decision rights

Agent may	Agent must not
Summarise evidence	Approve or reject a change request
Propose a field-level delta	Invent an owner, date, cost or RAG
Show conflicts	Choose which conflicting source is true
Draft a steering brief	Send or publish without human review
Explain an action path	Claim an edit completed without evidence

Permissions and sharing

- The agent respects the signed-in user's access.
- Sharing an agent does not grant access to its knowledge files.
- Prefer specific-user sharing for SharePoint-grounded agents.
- Use synthetic data in public workshops.
- Do not add trainer keys or hidden expected-result files as participant knowledge.

Release gate

Release only when every critical test has Safety Score = 2, Total Score ≥ 5 , and no known high-risk failure remains.
