

# Lab 4 Prompt Card

Create, test, update and reuse a professional tone of voice with Microsoft Copilot.

## CORE RULE

Keep the source facts fixed. Change one tone parameter at a time and compare against the same test case.

### 1. Analyse the writing samples

Analyse only the supplied writing samples.

Identify recurring patterns in opening, formality, warmth, directness, sentence length, vocabulary, structure, problem explanation, actions and closing.

For every proposed rule, cite two supporting examples and mark it Consistent or Uncertain. Do not treat typing errors, names, dates or case-specific wording as tone rules.

### 2. Build Tone Profile v1.0

Using only the human-approved rules, create Tone Profile v1.0.

Include: voice characteristics; warmth 1-5; directness 1-5; formality 1-5; preferred structure; vocabulary; phrases to avoid; how to explain delays; how to request action; accuracy safeguards; channel variations.

Do not add a rule that was not approved.

### 3. Apply the profile

Using the fixed Project Atlas facts and Tone Profile v1.0, draft the client email.

Preserve every confirmed fact. Do not invent a promise, reason, owner, deadline, apology or approval. After the email, list which tone rules you applied.

### 4. Evaluate the output

Compare the new draft with the baseline. Score 1-5 for: factual fidelity, outcome-first structure, warmth, directness, clarity, audience fit and minimal editing required. Cite the sentence that supports each score. Return exceptions before recommendations.

# Controlled tone update

5. Prepare one-rule change

Update my existing tone profile using the feedback below.

Feedback: [paste feedback]

Identify the one existing rule affected. Return: current rule; proposed rule; reason; expected effect; possible unintended effect; parameters that must stay unchanged; validation test. Do not rewrite the complete profile yet.

6. Test one parameter

Keep the source facts, structure, length, directness and vocabulary unchanged.

Change only the warmth of the opening and closing from 2/5 to 3/5.

Return: revised email; exact sentences changed; why each change increases warmth; confirmation that no other parameter changed.

7. Update the version

Create Tone Profile v1.1 by applying only the approved change request. Preserve all other v1.0 rules word for word.

Return: updated complete profile; change log row; rollback instruction; short test prompt.

8. Audience stress test

Use the approved tone profile and fixed Project Atlas facts. Change only the audience to [existing client / technical lead / executive sponsor]. Adapt detail and terminology without changing the core voice, facts, decision status or next action.

## Where to store the approved profile

| Location                         | When to use                                          | How to save                                                                     |
|----------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------|
| Copilot Notebook                 | Controlled workspace with examples and project files | Notebook > More options (...) > Instructions > edit > Save                      |
| Copilot Chat custom instructions | General personal communication preferences           | Settings and more (...) > Chat settings > Personalization > Custom instructions |
| Saved prompt                     | Repeatable task-specific request                     | Save the approved task prompt for reuse                                         |

**FINAL CHECK**  
Tone never overrides facts, authority, permissions or human responsibility. Roll back if the new version performs worse on the fixed test case.
