

Lab 12 - Controlled Collaboration with Copilot Pages

Participant workbook | Level 200 | 55-70 minutes

Purpose

Turn a grounded Copilot response into a persistent collaborative Page without converting discussion, proposals or post-meeting corrections into an approved business record.

Expected result

- A Page with confirmed facts, approved decisions, actions, risks, open questions and source references.
- A separate Source and Change Register showing authority, verification and edits.
- A controlled Word or PDF output produced only after human release.

Capability check

Check	Record
Can you attach the six source documents in Copilot Chat?	Yes / No
Is the pencil-shaped Edit in Pages button visible?	Yes / No
Can you share a Page link or component?	Yes / No
Can you browse earlier Page versions?	Yes / No
Can you use Create > Document or PDF?	Yes / No

The evidence hierarchy

Rank	Source type	Use
1	Approved decision record	Authoritative decision and scope.
2	Approved status and risk records	Authoritative facts, measures, risks and owners.
3	Named-owner chat correction	Operational correction requiring claim-level review.
4	Meeting transcript	Evidence of discussion; not approval.
5	Manager preference or proposal	Keep as Proposed; never promote automatically.

Exercise 1 - Create a grounded draft

1. Download and open all Project Nova source files.
2. In Microsoft Copilot Chat, attach the approved records, transcript and post-meeting chat.
3. Use the draft prompt from the Prompt Card.
4. Check every number, owner, date, decision and scope against the sources.
5. Correct unsupported statements in Chat before promoting the response.

Exercise 2 - Promote to Copilot Pages

1. Below the verified response, select the pencil-shaped **Edit in Pages** button.
2. If your experience supports automatic creation, you may instead ask: *Create a page called Project Nova Weekly Decision Page.*
3. Rename the Page and keep Copilot Chat open beside it.
4. Confirm that Confirmed, Calculated, Proposed and Not confirmed remain visibly separated.

Exercise 3 - Collaborate without losing control

1. Select **Share** in the upper-right corner.
2. Choose **Page link** to share only the Page, or **Copy component** to place a synchronized component in Teams or Outlook.
3. Ask a partner to make one authorized edit: change the dashboard owner from Tomas Weber to Sarah Kim and record the source chat message.
4. Add Mark Feld's 60-user suggestion only under Proposed.
5. Use the previous-version arrows to inspect the earlier Page version. Restore it only if the test edit changed an approved fact.

Exercise 4 - One-change test

1. Replace Status Report v4 with approved Status Report v5.
2. Ask Copilot to update only claims affected by the replacement source.
3. Expected change: High-severity defects decreases from 2 to 1.
4. Budget, total defects, status, security checks, risks, scope and decisions must remain unchanged.

Exercise 5 - Release to a formal deliverable

1. Complete the Release Check sheet in the workbook.
2. Obtain the named human approval.
3. In the upper-right corner of the Page, select **Create > Document** to prepare a Word draft, or **Create > PDF** for a fixed snapshot.
4. Open the generated output and verify it against the released Page.
5. Store the formal output in the organization's approved system of record.

Stop conditions

- A proposed date or scope is shown as approved.
- The Page omits the authority or source for a material claim.
- A collaborator changes an approved decision without authorization.
- A Page link grants broader access than intended.
- The formal output differs from the released Page.

Debrief

- What became easier after moving from Chat to a Page?
- Which source controlled the 40-user scope?
- Why did the post-meeting chat change an action owner but not the decision?
- When did the Page become ready for formal release?
- Which system, not Copilot Pages, holds the official record?
